The Flood Insurance Rate Map (FIRM) is a document used to identify areas that are likely to be flooded during a flood event. The FIRM is updated periodically to reflect changes in flood risk and is used by insurance companies to determine flood insurance rates. The document contains detailed information about the flood risk in the area, including flood zone designations, floodplain boundaries, and floodway locations. The FIRM is an important tool for homeowners, businesses, and communities to understand their flood risk and plan accordingly.
